Important Questions for Class 12 Physics Chapter 12 Atoms Class 12 Important Questions

December 6, 2019 by Sastry CBSE

Important Questions for Class 12 Physics Chapter 12 Atoms Class 12 Important Questions

Atoms Class 12 Important Questions Very Short Answer Type

Question 1.

Define ionisation energy. What is its value for a hydrogen atom? (All India 2010)

Answer:

Ionisation energy : The energy required to knock out an electron from an atom is called ionisation energy of the atom.

For hydrogen atom it is 13.6 eV.

When you need funds, make a simple choice

Question 3.

What is the ratio of radii of the orbits corresponding to first excited state and ground state in a hydrogen atom? (Delhi 2010)

Answer:

$$\text{Radius of Bohr's stationary orbits, } r = \frac{n^2 h^2}{4\pi^2 m K e^2}$$

Clearly, $r \propto n^2$ and in ground state, $n = 1$

For 1st excited state, $n = 2$

$$\therefore \text{Ratio of radii of the orbits} = \frac{2^2}{1^2} = \frac{4}{1} = 4 : 1$$

Question 4.

The radius of innermost electron orbit of a hydrogen atom is 5.3×10^{-11} m. What is the radius of orbit in the second excited state? (Delhi 2011)

Answer:

$$r = n^2 \times 5.3 \times 10^{-11} \text{ m}$$

\therefore Radius of second excited state ($n = 3$) is :

$$r = (3)^2 \times 5.3 \times 10^{-11} \text{ m} = 9 \times 5.3 \times 10^{-11} \text{ m}$$

$$= 4.77 \times 10^{-10} \text{ m}$$

Question 5.

Find the ratio of energies of photons produced due to transition of an electron of hydrogen atom from its

(i) second permitted energy level to the first level, and

(ii) the highest permitted energy level to the first permitted level. (All India 2010)

Answer:

We have, -

$$E_2 - E_1 = \text{const.} \left(\frac{1}{1^2} - \frac{1}{2^2} \right) = \text{const.} \frac{3}{4}$$

$$\text{and } E_{\infty} - E_1 = \text{const.} \left(\frac{1}{\infty^2} - \frac{1}{1^2} \right) = \text{const.} \frac{1}{4}$$

$$\therefore \text{Ratio} = 3 : 1$$

Question 6.

The ground state energy of hydrogen atom is -13.6 eV. What are the kinetic and potential energies of

explain the atomic structure? (All India 2012)

Answer:

As the revolving electron loses energy continuously, it must spiral inwards and eventually fall into the nucleus. So it was not able to explain the atomic structure.

Question 8.

When is H_α line of the Balmer series in the emission spectrum of hydrogen atom obtained? (Comptt. Delhi 2012)

Answer:

Balmer series is obtained when an electron jumps to the second orbit ($n_1 = 2$) from any orbit $n_2 = n > 2$.

Question 9.

What is the maximum number of spectral lines emitted by a hydrogen atom when it is in the third excited state? (Comptt. All India 2012)

Answer:

For third excited state, $n_2 = 4$, and $n_1 = 3, 2, 1$ Hence there are 3 spectral lines.

Atoms Class 12 Important Questions Short Answer Type SA-I

Question 10.

(i) In hydrogen atom, an electron undergoes transition from 2nd excited state to the first excited state and then to the ground state. Identify the spectral series to which these transitions belong.

(ii) Find out the ratio of the wavelengths of the emitted radiations in the two cases. (Comptt. All India 2012)

Answer:

Question 13.

Using Rutherford model of the atom, derive the expression for the total energy of the electron in hydrogen atom. What is the significance of total negative energy possessed by the electron? (All India 2012)

Answer:

Expression for total energy of electron in H-atom using Rutherford model : As per Rutherford model of atom, centripetal force (F_c) required to keep electron revolving in orbit is provided by the electrostatic force (F_e) of attraction between the revolving electron and nucleus.

The negative sign indicates that the revolving electron is bound to the positive nucleus.

Question 14.

Using Bohr's postulates of the atomic model, derive the expression for radius of n th electron orbit. Hence obtain the expression for Bohr's radius. (All India 2012)

Answer:

Basic postulates of Bohr's atomic model:

(i) Every atom consists of a central core called nucleus in which entire positive charge and mass of the atom are concentrated. A suitable number of electrons revolve around the nucleus in circular orbit. The centripetal force required for revolution is provided by the electrostatic force of attraction between the

difference in the total energy of electron in the two permitted orbit is absorbed when the electron jumps from inner to the outer orbit and emitted when electron jumps from outer to inner orbit.

Radii of Bohr's stationary orbits. According to Bohr's postulates, angular momentum of electron for any permitted orbit is,

Also, according to Bohr's postulates, the centripetal force is equal to electrostatic force between the electron and nucleus.

Question 15.

Show that the radius of the orbit in hydrogen atom varies as n^2 , where n is the principal quantum number of the atom. (Delhi 2012)

Answer:

When an electron moves around hydrogen nucleus, the electrostatic force between electron and hydrogen nucleus provides necessary centripetal force.

Also we know from Bohr's postulate,

(ii) For most of the α -particles, impact parameter is large, hence they suffer very small repulsion due to nucleus and go right through the foil.

(iii) Trajectory of α -particles

It gives an estimate of the size of nucleus, that it relatively very very small as compared to the size of atom.

Question 20.

Define ionization energy.

How would the ionization energy change when electron in hydrogen atom is replaced by a particle of mass 200 times that of the electron but having the same charge? (All India 2016)

Answer:

Definition of ionization energy : "The minimum energy, required to free the electron from the ground state of the hydrogen atom, is known as Ionization Energy."

The ionization energy is given by :

∴ Ionization Energy will become 200 times,
∴ the mass of given particle is 200 times.

Question 26.

Write two important limitations of Rutherford nuclear model of the atom. (Delhi 2016)

Answer:

Important limitations of Rutherford Model :

1. According to Rutherford model, electron orbiting around the nucleus, continuously radiates energy due to the acceleration; hence the atom will not remain stable.
2. As electron spirals inwards; its angular velocity and frequency change continuously; therefore it. will emit a continuous spectrum.

Question 27.

Find out the wavelength of the electron orbiting in the ground state of hydrogen atom. (Delhi 2016)

Answer:

Question 28.

Find the wavelength of the electron orbiting in the first excited state in hydrogen atom. (Delhi 2016)

Answer:

Question 29.

A 12.5 eV electron beam is used to excite a gaseous hydrogen atom at room temperature. Determine the wavelengths and the corresponding series of the lines emitted. (All India 2016)

Question 40.

(a) Using Bohr's second postulate of quantization of orbital angular momentum show that the circumference of the electron in the n^{th} orbital state in hydrogen atom is n times the de-Broglie wavelength associated with it.

(b) The electron in hydrogen atom is initially in the third excited state. What is the maximum number of spectral lines which can be emitted when it finally moves to the ground state? (Delhi 2012)

Answer:

(a) According to the de-Broglie hypothesis, this electron is also associated with wave character.

Hence a circular orbit can be taken to be a stationary energy state only if it contains an integral number of de-Broglie wavelengths i.e. we must have

$$2\pi r = n\lambda$$

According to Bohr's-second postulate

Hence the circumference of the electron in the n^{th} orbital state in hydrogen atom is n times the de-Broglie wavelength associated with it.

(b) For third excited state $n = 4$

For ground state $n = 1$

[NCERT SOLUTIONS](#)[RD SHARMA](#)[CLASS 12](#)[CLASS 11](#)[CLASS 10](#)[CLASS 9](#)[CBSE SAMPLE PAPERS](#)[TEXTBOOK SOLUTIONS](#)

- (i) Beam of α -particles get deviated at various angles with different probabilities.
- (ii) α -particles with least impact parameter suffers larger scattering – rebounding on head on collision.
- (iii) For larger impact parameter, the particle remains almost undeviated.

Explanation:

The fact that the number of incident particles rebounding back is only a small of fraction, means that number of α -particles headon collision is small. This implies that the entire positive charge of the atom is concentrated in a small volume. This confirms that the nucleus of the atom has an upper size limit.

Question 59.

- (a) Using Bohr's theory of hydrogen atom, derive the expression for the total energy of the electron in the stationary states of the atom.
- (b) If electron in the atom is replaced by a particle (muon) having the same charge but mass about 200 times as that of the electron to form a muonic atom, how would
 - (i) the radius and
 - (ii) the ground state energy of this be affected?
- (c) Calculate the wavelength of the first spectral line in the corresponding Lyman series of this atom. (Comptt. Delhi 2012)

Answer:

- (a) Total energy of electron in Bohr's stationary orbit—K.E which is due to velocity and P.E. due to position of electron.

From the first postulate of Bohr's atom model,

Question 61.

(a) Draw a schematic arrangement of Geiger- Marsden experiment showing the scattering of α -particles by a thin foil of gold. Why is it that most of the α -particles go right through the foil and only a small fraction gets scattered at large angles?

Draw the trajectory of the α -particle in the coulomb field of a nucleus. What is the significance of impact parameter and what information can be obtained regarding the size of the nucleus?

(b) Estimate the distance of closest approach to the nucleus ($Z = 80$) if a 7.7 MeV α -particle before it comes momentarily to rest and reverses its direction. (Comptt. Delhi 2015)

It gives an estimate of the size of nucleus, that it relatively very very small as compared to the size of atom.

(b) K.E. of the α -particle = Potential energy possessed by beam at distance of closest approach.

Question 62.

(a) Write two important limitations of Rutherford model which could not explain the observed features of atomic spectra. How were these explained in Bohr's model. of hydrogen atom?

Use the Rydberg formula to calculate the wavelength of the H_α line.

(Take $R = 1.1 \times 10^7 \text{ m}^{-1}$).

(b) Using Bohr's postulates, obtain the expression for the radius of the n^{th} orbit in hydrogen atom. (Comptt. Delhi 2015)

Answer:

(a) Limitations of Rutherford Model :

(i) Electrons moving in a circular orbit around the nucleus would get, accelerated, therefore it would spiral into the nucleus, as it loses its energy.

(ii) It must emit a continuous spectrum.

Explanation according to Bohr's model of hydrogen atom :

(i) Electron in an atom can revolve in certain stable orbits without the emission of radiant energy.

TEXTBOOK SOLUTIONS

$$\lambda = 1.1 \times 10^{-7} (4 - 9) \text{ or } \lambda = 636.5 \text{ nm}$$

(b) Radius of n^{th} orbit

$$\text{We have, } \frac{mv^2}{r_n} = \frac{1}{4\pi\epsilon_0} \cdot \frac{e^2}{r_n^2}$$

$$\Rightarrow r_n = \frac{e^2}{4\pi\epsilon_0 v_n^2} \quad \dots(i)$$

From Bohr's Postulates:

$$mv_n r_n = \frac{nh}{2\pi}, \quad v_n = \frac{nh}{2\pi m r_n}$$

Substituting for v_n in equation (i), we get

$$r_n = \frac{\epsilon_0 n^2 h^2}{\pi m e^2}$$
